Digital Operations & AI Automation

A clearer website, better follow-up, and useful tools I can build and maintain.

I'm proposing a paid role owning website updates, follow-up preparation, and practical AI tools. I'm new to the electrical trade; your team brings that knowledge, and I'd start by learning your process.

About me

After earning a computer science degree, I worked for two and a half years as a WordPress developer at Clearwater, building marketing websites. When COVID hit, I started driving for DoorDash, and I've done that for the past four years. Now I want to get back into this kind of work and grow with a team.

Start with one useful assignment

One new service page for your website, built from facts you approve, with customer requests going straight to the right person. It would be my first piece of work in the role, finished and checked within the first 30 days.

Pay and hours

Open to discussion. I'm looking for a way into this kind of work, not top pay, and I'm glad to start part-time and grow the role as I prove useful.

Work you can inspect

Using AI tools, I built a sample commercial service page, a tool that sorts customer emails and drafts replies, a review of the current website, eight blank office templates, and this proposal.

I tested the tool on 40 made-up customer emails. **It passed every check on 40 of 40**, sent all 6 of 6 emergencies straight to a person, and had 0 replies flagged as a problem. The proposal website shows exactly what it wrote.

I wrote the test emails myself, so real emails may go differently. Nothing is sent automatically. A person reads and approves every reply.

The first 90 days

Days 1–30 · Learn and deliver
Finish the first service page, learn how customer requests move through the office, and measure how long it takes today.

Days 31–60 · Own and test
Own website updates and follow-up preparation. Test the AI tool on real company emails, with names and contact details removed, against checks we agree on.

Days 61–90 · Compare and decide
If the test goes well, try it on a small number of new requests, with a person approving every reply. Compare time, quality, and cost, then decide whether to expand, adjust, or stop.

What I would own

- Keep website wording, facts, and pages current.
- Keep records of customer requests, draft replies, and follow-up reminders.
- Test and maintain approved AI tools, with people reviewing the outputs.
- Write short instructions and provide a weekly progress update.

Tool costs: $400 a month, never more

The company provides and pays for two AI accounts in its own name: **Claude Max ($200 tier)** and **ChatGPT Pro with Codex ($200 tier)**. No pay-as-you-go credits, add-ons, or usage fees; those settings stay off. If a limit is reached, the work waits or is done by hand. Any change needs written approval.

Everything I build belongs to the company

Website changes, templates, and tools stay in company accounts. If the role ends, I hand everything over with written notes.

How we would judge the work

How quickly customers hear back, whether requests arrive with the details you need, whether every request has someone responsible and a next step, and staff time per email. Any time savings must count the time spent checking and fixing.

The decision to make together

Choose a first assignment, agree paid hours and compensation, name a manager and approver, and set a delivery date and first review. A 30-minute conversation is the next step.
